

Apple Watch may move the needle on wearable tech

SAN FRANCISCO, US: Apple launched its first new product category since 2010, with its smartwatch...

Prior to the launch Apple's chief executive Tim Cook revealed little about the sophisticated wrist wear, other than that he "can't live without it."

The company announced its plans for Apple Watch last year to much fanfare and has said it would begin shipping in April. It marks Apple's first new product type since the iPad in 2010.

Apple enter a market that already has a number of players, ranging from South Korean giants Samsung and LG, to Japan's Sony and startups such as Pebble.

Motorola, acquired by Chinese giant Lenovo last year, also produces a smartwatch, and China's Huawei introduced its version at the Mobile World Congress in Barcelona this month.

But analysts expect Apple to lift the market by integrating the watch with the iPhone and its software ecosystem, and its range of apps and sensors for health and fitness.

"How Apple creates a cohesive value proposition integrating hardware with software and services is as always the key," said Nick Spencer at ABI Research.

"The three main areas of wellness data and services, Apple Pay, along with creating an intelligent and differentiated relationship between the watch and the smartphone must be the foundations of the Apple Watch proposition."

Apple has indicated that the entry price would be \$349 in the United States, and that two different sizes would be available in three collections, including the "Apple Watch Edition," featuring 18-carat gold cases in yellow or rose, sapphire crystal and finely crafted bands and closures.

The watch is also expected to include map software that guides people to destinations with gentle "taps" on the wrist.

Fitness apps on the Apple Watch and its rivals could spell trouble for makers of fitness bands from companies like Jawbone, Fitbit and Nike.

Jan Dawson at Jackdaw Research said Apple must find the right balance for the new device - giving people alerts and notifications when they need them without overwhelming them.

"One of the criticisms of some of the other watches out there is that notifications are something of an all-or-nothing phenomenon: either you get utterly bombarded with notifications or you get none, but its been tough to get granular control," Dawson says in a blog post.

"So it becomes all the more important that Apple get this right on the Watch. The ability to manage notifications and other activity on the Watch so that you only get notified for the things you really care about is a key value proposition."

Apple reportedly had to scale back health tracking features on the watch after some sensors didn't rise to the challenge.

Research firm Strategy Analytics predicts Apple will set fire to the market from the outset, projecting sales of 15.4 million units worldwide in 2015, to give Apple a 55% market share.

More conservative, ABI Research expects Apple to ship 13.77 million units, just under 50% of the market.

But Spencer said Apple needs to meet consumer needs for battery life, and offer the right mix of services and apps.

Roger Kay, analyst at Endpoint Technologies Associates, said Apple's loyal consumer base will deliver a certain number of sales but won't guarantee widespread adoption.

Kay said Apple needs to find a way to integrate the watch into a new kind of intuitive computing which is only now emerging. "No one knows yet whether the wearables category is going to make it," Kay said.

"One thing that could help, though, is a rich set of tactile effects that only wearables - which, by definition, lie close to the body - can deliver."
